

In short: the brief is sound and its scope guardrails are exactly right. It needs five small fixes before anyone builds from it. The register should **not** live in the Fabric database. Start capturing now in a **SharePoint List** (Seadrill sign-in, no IT work), then make the register the **first small Lovable build** from 26 October, as a low-risk pilot for the platform SACRED moves to in January.

WHAT THE BRIEF GETS RIGHT

- **The controlling rule:** nothing already managed in an enterprise system is duplicated.
- **The non-goals:** no tasks, Gantt, scheduling or productivity scoring; no replacing Maximo, P6, Synergi, AAB or MOC.
- One accountable owner and one next step per item; open items by default; a reason required to close.
- Capture in under two minutes; periodic review, not daily entry.

FIVE FIXES BEFORE IT IS BUILT

1. **Name the platform.** The pack asks the AI to choose the stack, sign-in and hosting: the very decisions that need IT.
2. **Name the triage owner and the review cadence.** Without them the register fills and goes stale.
3. **Drop "Percent Complete".** It contradicts "no artificial precision".
4. **Audit needs real sign-in.** "Who changed what" means nothing without a verified Seadrill identity.
5. **Route operational changes to MOC and HAZID,** by link, rather than only saying it will not replace them.

WHERE SHOULD IT LIVE?

Option	Sign-in	IT effort	Assessment
SharePoint / Microsoft List on the WellControl site NOW	Seadrill accounts, built in	None expected	Every field in the brief becomes a column. Filtered views give Active, My Initiatives, Needs Attention and Archive; version history is the audit trail; Excel export and mobile included; a flow can send stale reminders. Weakest on the Leadership Summary charts.
Lovable END STATE	Seadrill accounts (set up once)	One sign-in setup, already needed for SACRED	A real database with per-user permissions and a proper audit trail; Claude assistance built in; workspace collaboration so several people can build it together. Same platform as SACRED from January: one thing for IT to support, not another.
Fabric database NOT AS HOME	Needs IT	High	A data store, not an app: no screen to enter data without a front end and sign-in that IT would build. Today it sits in a personal workspace on a trial ending about 12 Nov, with no admin rights. Good later as a reporting copy, as SACRED uses it.
A password-gated HTML page NO	Shared password	None	No real identity, so no meaningful audit; adds to what has to be maintained and supported, during the build freeze and the move to Lovable.

DOES TRIAGE SLOW DOWN AI DEVELOPMENT?

Not if it is kept light. Most register items will be procedures, training, standards and studies, where build speed is not the issue; visibility is. For digital tools a working prototype often answers the triage question faster than a meeting, so the brief should say **a prototype or demo link is welcome evidence at triage**: build to show, triage before it is relied on. Fast building is also why a register is needed: tools appear quickly and someone has to own and support them. Anything that changes how operations run stays a pilot under deviation with MOC and HAZID, however quickly it was built.

RECOMMENDED PATH

1 · Now: SharePoint List

Columns from the brief, the five fixes applied, views for the six core screens. Triage owner and cadence named by the group. An afternoon's set-up; no new software.

2 · From 26 Oct: Lovable pilot

Small, no rig or operational data, but it proves the hard parts (Seadrill sign-in, permissions, audit, collaboration) before SACRED's larger cutover.

3 · Move the data

The List exports straight into the Lovable app; its columns become the table design. Nothing is retyped. Fabric can hold a reporting copy later.

HOW IT FITS WITH WHAT ALREADY RUNS

- **SACRED and its plan:** the register holds the headline (one owner, next step); detail stays in each project's own plan, as the brief's no-subtask rule intends.
- **AAB, MOC, HAZID, Maximo, Synergi, P6:** no clash; register items link to them and never copy them.
- **Ask SACRED AI and the SACRED database:** unaffected. Later, in Lovable, one assistant could answer questions across both.
- **AI tools:** the pack's three prompt versions are harmless, but one builder should be chosen. On Lovable that is Claude, pending Viren's confirmation as the main AI agent.

Decisions asked of the group

1. Agree the register starts as a SharePoint List now, not in the Fabric database.
2. Name the triage owner and the review cadence.
3. Accept the five fixes to the brief, including "a prototype is welcome evidence at triage".
4. Agree the register as the first Lovable pilot build from 26 October.
